

The title would be "Drones in logistics – challenges and opportunities" .

The logistics industry is the leader of the pack when it comes to using drones. Although still not fully developed, there are plenty of potential use cases of cargo UAVs (Unmanned Aerial Vehicles). As we can see, individual drone-based parcel delivery systems are already a reality. However, *there are still many problems to overcome*. We'll need an over-arching system under which these can exist. People must develop the infrastructure, determine the conditions, and implement the system.
